

Andropause And Changes In Male Hormones

Common Symptoms of Hormone Imbalance

- Lower Sex Drive
- Decreased Muscle Strength
- Decreased Muscle Mass
- Bone Loss
- Low Energy Level
- Fatigue
- Weight Gain Around the Waist
- Decreased Urine Flow
- Increased Urinary Urge
- Prostate Problems

TESTOSTERONE is the key to
life for men...period.

How can you check if your hormones are balanced?

- Saliva test for hormone levels.
- Review the results with your doctor.
- Determine together the hormone supplementation program best for you.
- Repeat testing and follow up with your practitioner as advised.

- Testosterone plays important roles in maintaining both physical and mental health. It increases energy, prevents fatigue, helps maintain normal sex drive, increases strength of skin, bone, and muscles — including the heart, and prevents depression and mental fatigue.
- The production of male hormones in the testes does not stop abruptly but instead tapers off steadily with age. This physiologic decrease can cause changes in sexual function, mood, energy level, and body composition. Declines in male hormone production start around age 40.
- While not as critical as testosterone men also produce estrogen and progesterone and do need to have those in balance for optimal health.
